

THE FUTURE OF ENERGY NETWORKS

EASTERN AUSTRALIAN ENERGY MARKET OUTLOOK CONFERENCE

17 SEPTEMBER 2014

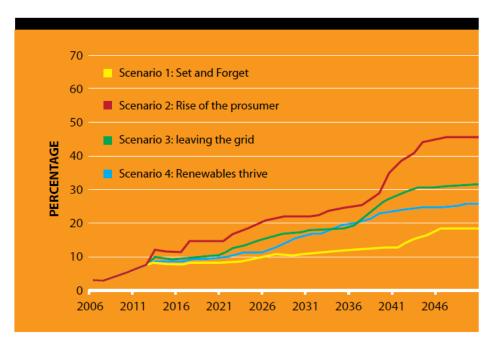

Focus for Today...

- > The changing role of centralised grids
- > The opportunities and threats of DER
- > How distribution and transmission business models are changing
- > Launch of the ENA & ARENA collaboration 'Renewable Energy Stocktake'

Potentially diverse futures for Network Use...

- No 'Right' Answers but Risk of Partial Substitute
- Exposure to highly volumetric tariffs
- Exposure to 'tipping points' through step changes in use and technology

FIGURE 1: PROJECTED SHARE OF ELECTRICITY
DELIVERED FROM ONSITE GENERATION

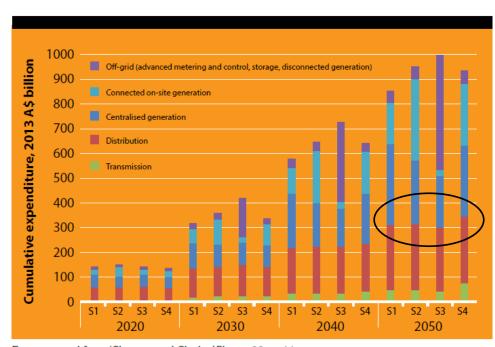

Data sourced from 'Change and Choice' Figure 16, p. 34

All scenarios require efficient access to capital...

- All Future Grid forum scenarios require over \$300 BN in capital investment
- Cost of Capital can be 50-70% of annual network revenue, so customers have a direct interest in low risk investment environment.
- Realistic Regulation needed -Regulator says risk is falling.

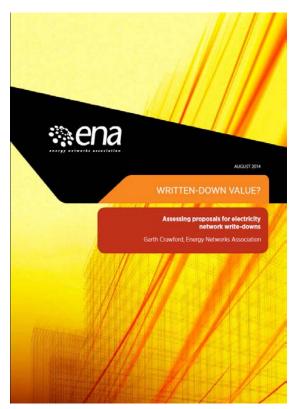

FIGURE 2: PROJECTED CUMULATIVE SYSTEM COST BY 2050

Data sourced from 'Change and Choice' Figure 23, p. 44

All scenarios require efficient access to capital...

- All Future Grid forum scenarios require over \$300 BN in capital investment
- Cost of Capital can be 50-70% of annual network revenue, so customers have a direct interest in low risk investment environment.
- Realistic Regulation needed -Regulator says risk is falling.
- Calls for Regulatory Asset
 Writedowns likely to increase costs to
 Consumers

Opportunities and Threats of DER

Grid is rapidly accommodating new assets

- > Australia is installing solar at a world-leading pace
- Hawaii often cited as at the edge of the solar envelope, with higher solar penetration than any mainland utility yet it is only at 10% and 300 MW
 - lower than most of our big states and dwarfed by Qld 23% (1000 MW) and SA 25% and 500 MW.
- > California, the largest has c.700 MW in 2013 and may get to 1600 MW by 2016.
- Perspective needed when networks are argued to be resisting connection of embedded generation

Shared Benefits in Embedded Integration

EMBEDDED GENERATION BENEFITS TO THE GRID

- » Reduced Transmission and Distribution losses
- Potential to defer network augmentation depending on geographic location and performance during peak periods.
- » Voltage support
- » Improve power system resilience
- » Potential emissions reduction

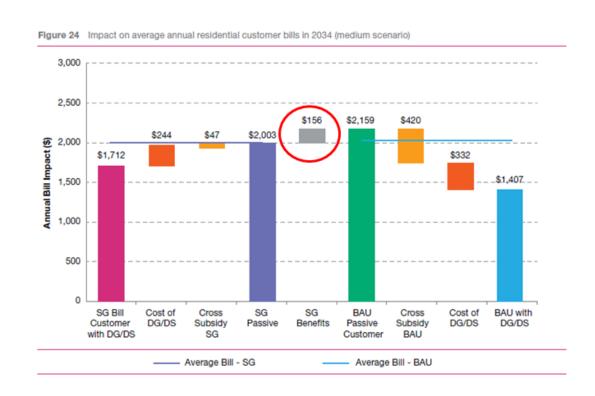

GRID BENEFITS TO EMBEDDED GENERATION

- » Provides access to upstream markets
- » Supports maintenance of reliability for intermittent embedded generation
- » Supports voltage quality important for end-use devices
- » Supports operating efficiency of embedded generation as output need not reflect local load
- » Supports startup power requirements of the customer, when peak current may increase significantly.

However, tariff reform essential to achieve efficient DG

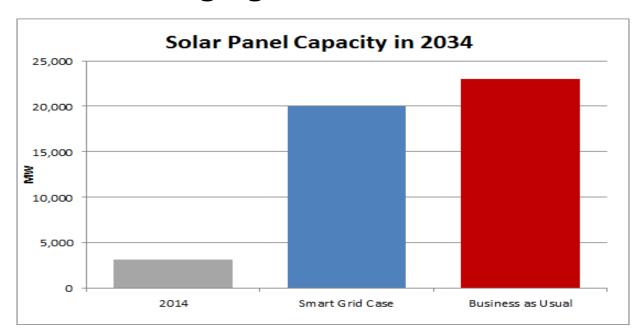

> Smart Grid Scenario assumes smart-meter enabled, cost reflective tariffs

- Avoiding \$10 BN over investment in onsite generation and storage
- > Saving \$156 p.a. on Average Bills.

Economic outcomes still see high growth in DER ...

> Smart Grid, Smart City indicated difference was a 700% increase in Solar PV, not 800% increase.

Significant dividends for fairness...

2,500

- Current A/C crosssubsidies of c. \$350 pa to \$700 pa.¹
- **Current Solar Cross** \$120 p.a^{.2}
- **Smart Grid Smart City** DG/DS to increase to \$420 p.a.

Figure 24 Impact on average annual residential customer bills in 2034 (medium scenario)

\$2,003

^{2,000} \$1,712 Subsidies estimated \$1,407 1,500 1,000 report shows potential 500 SG Bill Cost of Cross Cross Cost of BAU with DG/DS Subsidy Passive Passive Subsidy DG/DS DG/DS with DG/DS SG 1. Productivity Commission (2012), AEMC (2014) Draft Average Bill - SG Average Bill - BAU 2. AEMC (2014)

Determination (Distribution Pricing)

How will Networks adapt?

Short-term: Redefining Current Services

- > Real tariff reform essential to:
 - reduce exposure to highly volumetric tariffs which encourage duplication and higher costs to consumers
 - manage current cross subsidies; and
 - incentivise efficient distributed energy delivery
- > Transforming relationships with consumers:
 - Negotiated service delivery
 - Five year business plans
 - Infrastructure planning
 - Design of products and services
 - Reliability investment

Trust will be the basis of a long-term partnership with consumers

Diverse Pricing Options ...and Consequences

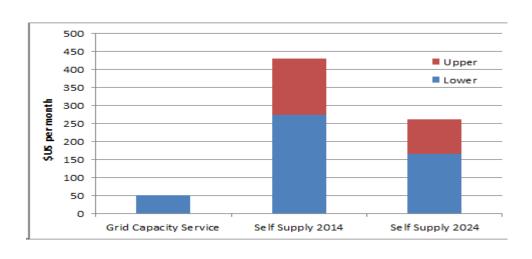

| Current Structures | Energy | Demand | Other |
|---------------------------|-------------------------|-----------------|-------------------------------------|
| - Increased Fixed charges | - Time of Use | - Anytime MD | \$/kW charge for net metering (APS) |
| - Declining Block tariffs | - Critical Peak Pricing | - Coincident MD | Fixed \$/month all customers (SDGE) |
| | - Peak Time Rebate | | |

> Challenges

- Simplicity, User Friendly
- Avoid prescriptive, one size fits all solutions.
- Allow service providers to tailor for customers in consultation with customers.

Grid services will compete on value to consumers...

- Efficiency of Supply
- New Services
- > Access to New Markets
- > Hidden services:
 - Back-up Service
 - Regulation (Balancing) Service
 - 'Start-up' service

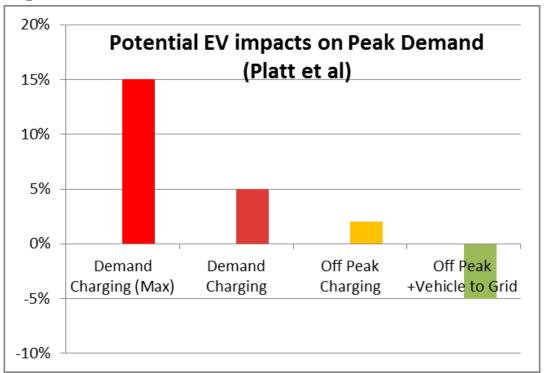

Data from EPRI – 'The Integrated Grid' (2014)

...making widespread 'grid defection' possible but unlikely.

Medium-term: redefining business models

- 1. Offering a wider range of customer centric services
- 2. Value to networks of optionality in future investment
 - Trade-offs between operating vs capital solutions
 - Non-network solutions to defer Infrastructure decision window
 - Innovation to build the market (e.g.Transgrid Powering Sydney's future)
 - Size of a customer connection.
- 3. 'Enabling Networks' and Distribution System Operators
 - Central to State of New York's Renewing the Energy Vision
 - Pacific North-West Smart Grid Demonstration Project
 - Storage Solutions focused on utility benefits

One example... Electric Vehicles in 2033

Platt, Paevere, Higgins and Grozev (2014) in Distributed Generation and its Implications for the Utility Industry

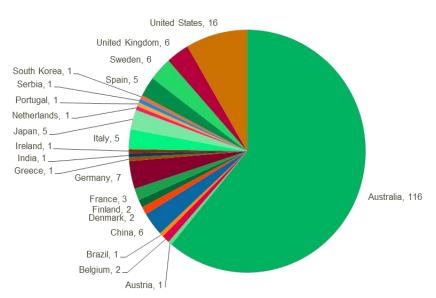

Stocktake: Database of renewable energy grid integration projects

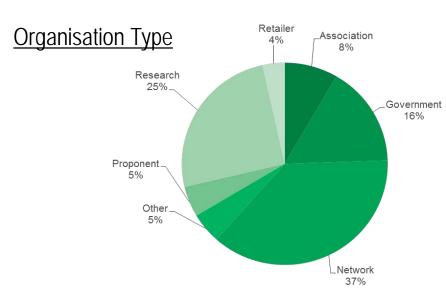

ARENA Stocktake

Country of Origin

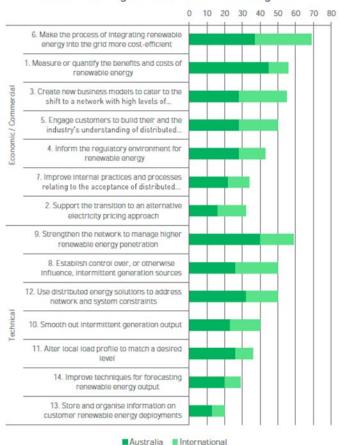

The final stocktake includes 176 projects, of which 116 are from Australia.

ENA

How will this stocktake help?

- Help the industry understand the state of knowledge – the first step to improving it…
- Form a view of common / thematic
 opportunities and barriers by synthesising the
 stories from each approach
- Make it easier for **networks** and **proponents** to share information about how opportunities can be exploited, and barriers overcome
- Avoid duplication of effort ("reinventing the wheel")

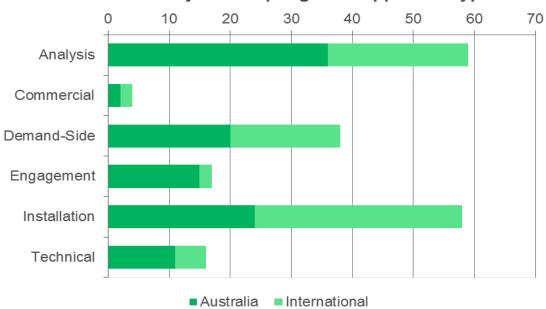

Number of Projects that address each Objective

Project Categories

| Analysis | Desk-based analysis, research, and modelling | | |
|--------------|--|--|--|
| Commercial | Joint ventures between organisations, internal initiatives, and policy advocacy | | |
| Demand-Side | Influencing customer loads through pricing, incentives, and direct control | | |
| Engagement | Interviews and Surveys | | |
| Installation | Installing distributed energy resources on the network | | |
| Technical | Changing the operation of the network through new approaches or equipment upgrades | | |

Number of Projects adopting each Approach Type
